the general-purpose simplex method. Formulating and solving network problems via linear programming is called network flow programming. Any network flow problem can be cast as a minimum-cost network flow program. A min-cost network flow program has the following characteristics. Variables. The unknown flows in the arcs, the  $x_i$

treatment of linear optimization, that is, linear programming, network flow problems, and discrete linear optimization. We discuss both classical topics, as well as the state of the art. We give special attention to theory, but also cover applications and present case studies. Our main objective is to

planning and scheduling problems still dominate the applications of linear programming. One reason that linear programming is a relatively new field is that only the smallest linear programming problems can be solved without a computer. 1.3 Example (Adapted from [1].) Linear programming problems arise naturally in production planning.

2.4 A Linear Programming Problem with no solution. The feasible region of the linear programming problem is empty; that is, there are no values for  $x_1$  and  $x_2$  that can simultaneously satisfy all the constraints. Thus, no solution exists. 2.5 A Linear Programming Problem with Unbounded Feasible Region: Note that we can continue to make level ...

Linear Programming and Network Flows, Fourth Edition is an excellent book for linear programming and network flow courses at the upper-undergraduate and graduate levels. It is also a valuable resource for applied scientists who would like to refresh their understanding of linear programming and network flow techniques.

inequalities and they are all linear in the sense that each involves an inequality in some linear function of the variables. The first two constraints,  $x_1 \geq 0$  and  $x_2 \geq 0$ , are special. These are called nonnegativity constraints and are often found in linear programming problems. The other constraints are then called the main constraints ...
