Space is the boundless three-dimensional extent in which objects and events have relative position and direction. Physical space is often conceived in three linear dimensions, although modern physicists usually consider it, with time, to be part of a boundless four-dimensional continuum known as spacetime. The concept of space is considered to be of fundamental importance to an understanding of ...

Spatial coherence. In some systems, such as water waves or optics, wave-like states can extend over one or two dimensions. Spatial coherence describes the ability for two points in space, x_1 and x_2 , in the extent of a wave to interfere, when averaged over time. More precisely, the spatial coherence is the cross-correlation between two points in a wave for all times.

It has sometimes been suggested that quantum phenomena exhibit a characteristic holism or nonseparability, and that this distinguishes quantum from classical physics.

In this comment we address the preprint of Jha and Hirata (arXiv:1809.10316 [physics.chem-ph]) which claims "Numerical Evidence Falsifying Finite-Temperature Many-Body Perturbation Theory." We agree that finite difference differentiation of the exact grand potential is the correct way to verify the terms in the perturbation expansion.

To make interacting photons, the team shone a weak laser through a cloud of cold rubidium atoms. Rather than emerging from this cloud separately, the photons within the laser merged bound in groups of three.

Intuitive Concepts in Quantum Mechanics - Scriptural Physics

We propose a protocol for quantum state tomography of nonclassical states in optomechanical systems. Using a parametric drive, the procedure overcomes the challenges of weak optomechanical coupling, poor detection efficiency, and thermal noise to enable high efficiency homodyne measurement.

2 A spatial graph is the union $\hat{\Gamma}$ of some strings with endpoints in \mathbb{R}^3 which are mutually disjoint except the endpoints. A vertex of a spatial graph $\hat{\Gamma}$ is a point in $\hat{\Gamma}$ gathering more than 3 strings and an edge of $\hat{\Gamma}$ is a connected component of the strings obtained from $\hat{\Gamma}$ by cutting along all the vertices of $\hat{\Gamma}$. For example, Kinoshita's $\hat{\Gamma}_3$ -curve in Figure 2 is a
